

Section 7.3 – Special Right Triangles

The 45°-45°-90° Triangle

In a 45°-45°-90° triangle, the hypotenuse is $\sqrt{2}$ times as long as each leg.

$$\text{Leg} \cdot \sqrt{2} = \text{Hypotenuse}$$

The 30°-60°-90° Triangle

In a 30°-60°-90° triangle, the hypotenuse is twice as long as the shorter leg, and the longer leg is $\sqrt{3}$ times as long as the shorter leg.

$$\text{Short Leg} \cdot \sqrt{3} = \text{Long leg}$$

$$\text{Short Leg} \cdot 2 = \text{Hypotenuse}$$

Important Note: The short leg is opposite of the 30° angle.
The long leg is opposite of the 60° angle.

For a 45°-45°-90° triangle, the leg times _____ is equal to the hypotenuse.

For a 30°-60°-90° triangle, the short leg times _____ is equal to the long leg.

For a 30°-60°-90° triangle, the short leg times _____ is equal to the hypotenuse.

Ex 1:

Find the value of the variable(s).

a)

b)

c)

STUDENT PRACTICE:

d)

e)

f)

Ex 2:

Find the value of the variable(s).

a)

b)

c)

Getting a fraction to NOT have a denominator that is a radical is called

_____.

Ex 3:

Find the value of the variable(s).

a)

b)

Ex 4:

a) Find the area of the regular triangle.

b) Find the area of the triangle.

c) The altitude (height) of an equilateral triangle is 9 cm. Find the length of a side of the triangle.

Ex 5:

a) The perimeter of a square is 28 inches.
Find the length of the diagonal.

b) The diagonal of a square is 6 meters.
Find the area of the square.
