A $\qquad$ is a point that $\qquad$ (cuts in half) a segment.

## Ex 1:

a) $M$ is the midpoint $\overline{A B}$. Find $A M$.

$$
\begin{aligned}
& A M=6 x+7 \\
& M B=4 x+5
\end{aligned}
$$

b) $M$ is the midpoint $\overline{\mathrm{CD}}$. Find MD.
$\mathrm{CM}=3 \mathrm{x}-1$
MD $=x+9$

A point $\qquad$ two points does $\qquad$ necessarily mean that it lies in the middle.

## Ex 2:

a) B is between points A and C . Find AC .

$$
\begin{aligned}
& \mathrm{AB}=\mathrm{x} \\
& \mathrm{BC}=4 \\
& \mathrm{AC}=2 \mathrm{x}-9
\end{aligned}
$$

b) $Y$ is between points $X$ and $Z$. Find $X Z$.
$X Y=2 x$
$\mathrm{YZ}=6$
$X Z=3 x-8$

## Ex 3:

a) $\overrightarrow{W Z}$ bisects $\angle X W Y$. Find the two angles measures not given in the diagram.

b) $\overrightarrow{\mathrm{BD}}$ bisects $\angle \mathrm{ABC}$. Find the two angles measures not given in the diagram.

$\qquad$ angle has the indicated measure.

## Ex 4:

a) $\overrightarrow{\mathrm{WZ}}$ bisects $\angle \mathrm{XWY}$. Find the two angles measures not given in the diagram.

b) $\overrightarrow{\mathrm{BD}}$ bisects $\angle \mathrm{ABC}$. Find the two angles measures not given in the diagram.

## Ex 5:

a) Given $\mathrm{m} \angle \mathrm{WXZ}=80^{\circ}$, find $\mathrm{m} \angle \mathrm{YXZ}$.

b) Given $\mathrm{m} \angle \mathrm{ABC}=121^{\circ}$, find $\mathrm{m} \angle \mathrm{DBC}$.

## Ex 6:

b) $\overrightarrow{\mathrm{BD}}$ bisects $\angle \mathrm{ABC}$. Find $\mathrm{m} \angle \mathrm{ABC}$.
